

HOW TO DRAIN YOUR HOT TUB

SUPERIOR
WELLNESS

Draining

Submersible Pump

The fastest way to drain your spa is to use a submersible pump.

1. Make sure to pour the correct measurements of Hot Tub Flush into your spa
2. Once you have done this switch your jets on with your cover off for at least 60 minutes. Don't worry if brownish, foamy goo comes to the surface - this means the cleaner is working.
3. Next switch your jets off and close your valves using your diverters.
4. Turn your Spa off at the mains
5. Now drop your submersible pump in the water with your hose close to a drain.
6. Switch the Submersible Pump on at the main switch
7. Once you have drained your spa you may have water still inside the foot well. If so switch your submersible pump off and take it out of your spa.
8. To get rid of the remaining water you will need to buy a wet vacuum.

IMPORTANT:

Make sure the water is emptied into a drain and not on the grass.

Drain Valve

To drain the spa:

1. Twist the cap clockwise and pull out at the same time (A)
2. Once the plug is out fully you can then spin off the cap anti clockwise (B)
3. Screw on the hose pipe attachment. Connect the hose, then push in half way to release the valve (C).

At this point the spa will start draining.

Final Tip

If you're going to be leaving the spa empty for a while, don't forget to remove water from the lines, too. A new layer of biofilm can build up quickly if the water is allowed to stay in the pipes, and you'll be right back at square one when you refill! This can be done with a wet/dry vacuum to blow and/or suck the water out. Or, if your spa has one, briefly turn on the air blower, making sure all jets are open first. Remember to turn the power back off once you're done with the air blower.

Thoroughly dry the tub with a soft towel. Next, use a spa cleaning chemical to remove tough scum and protect the tub surface. Finish cleaning (or replace) the filter cartridge, clean and condition the cover, and hose off the spa cabinet if it's looking dirty. If you're not refilling the hot tub right away, allow the filter to dry completely, and store it indoors.
